

Installation of Shade on a Greenhouse

1. Unfold the shade cover lengthwise next to the greenhouse.

2. Attach shade cover clips (purchased separately) to the edges of the shade fabric every 2' to 4'. To attach, fold clips in half with the edge of the shade fabric in between. Press together until the two ends of the shade clip snap together.

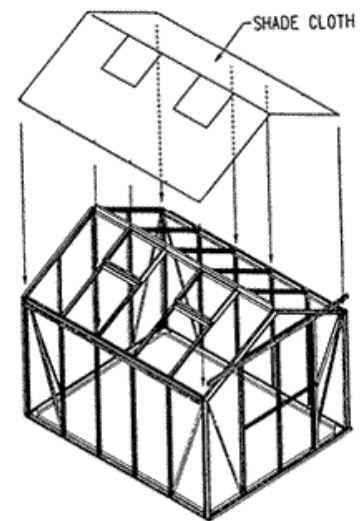

3. Fasten ropes (purchased separately) to the corner shade cover clips and throw them over the greenhouse. Pull shade cover over greenhouse with these ropes until the cover is even on both sides.

4. Tie down the shade cover to the greenhouse by fastening ropes attached to the shade cover clips to the ground, greenhouse base/foundation, or greenhouse frame.

5. If the greenhouse has roof and/or side vents which are covered by the shade fabric, take a pair of scissors and cut the shade fabric around the bottom and sides of the vent (forming a U shape that matches the opening of the vent). Then fasten the cut portion of shade fabric to the vent with a piece of wire or string to hold it in place.

Example of our 12' wide green shade fabric installed on a Juliana greenhouse.
